Release Notes for JMP 19.0.3

JMP 19.0.3 is a targeted maintenance release to fix the following issues in JMP, JMP Pro, and JMP Clinical:

- In the Profiler, when multithreading is not used and you perform several optimizations, the random seed now correctly reseeds at each iteration restart.

- When you share data connectors, the associated configurations now appear.

- Performance has improved when updating a data table from Python with the jmp.run_jsl option.

- The Categorical platform no longer closes unexpectedly when you create a report interactively with the Filter platform preference enabled.

- Windows installations of JMP now include the Microsoft Visual C++ Redistributables in the Extra folder, providing easy access if manual installation is needed.
